

Use of RKW Hyplast NV Polyethylene silage films

RKW Hyplast NV PE-silage films have been developed for covering silage and animal nutrition. The RKW Hyplast NV PE-silage films consist of Polyethylene (LDPE, LLDPE) and several masterbatches. With RKW Hyplast NV PE-silage films all agricultural plant products can be covered for ensiling or storing and / or covering crops and fodder, which are planned to be used later for animal nutrition or biogas production. Animal fodder for example is processed in the animal's stomach in a specific way that at the end of the process it produces milk or meat. Until now no negative influences on milk or meat quality are known from the use of RKW Hyplast NV PE-silage films as covering systems.

Based on our actual knowledge, there are no legal restrictions or regulations concerning the use of RKW Hyplast NV PE-silage films for the production of animal nutrition.
